

Application No. 10/810,049
Amendment dated August 4, 2006
Reply to Office Action of April 6, 2006

AMENDMENT TO THE SPECIFICATION

Please replace paragraph [0013] as originally filed with the following:

[0013] Several vacuum treatments for ophthalmic and sunglass lenses are commercially available, of which antireflection coatings, multilayer coatings, and mirror coatings are most prevalent. These treatments are designed to achieve a particular aesthetic effect on the lens by controlling the appearance of the lens, such as the color of the reflection of the lens or by providing a mirrored look. Preferably, certain embodiments of the invention exhibit a colored, silver and/or mirror like appearance when observed from a side opposite the lens.

Please replace paragraph [0031] as originally filed with the following:

[0031] Thus, the thin films of the present invention provide an improved coating for use with photochromic lenses and the like. While there have been shown and described and pointed out novel features of the present invention as applied to preferred embodiments thereof, it will be understood that various omissions and substitutions and changes in the form and details of the disclosed invention may be made by those skilled in the art without departing from the spirit of the invention. For example, the number of layers is not limited to that disclosed in the examples described herein, and can include 100 or more layers without deviating from the scope of the invention. Furthermore, it may be preferable to provide a film having an activation value of greater than 90%, more preferably greater than 97% of the photochromic lens upon which the film is applied. It is the intention, therefore, to be limited only as indicated by the scope of the claims appended hereto.
